Answer the following questions

Question 1

Comment out the asm line. Run the program again to see what would happen. What do you observe that happens differently than before:

The print statements print "CPU come out WFI..." really fast. Faster than if it wasn't commented out.

Question 2

In terms of CPU power consumption, what difference does the asm statement make?

If each print statement take a bit of power, having it continuously print really fast, it would drain a lot of power whereas compare to when it print periodically.
